

Abstract

Until now visual extrapolations of a, for example critical,
measurement value pattern and/or subjective evaluations of the
5 impact on technical parameters were undertaken for the purposes of
trend analysis, in order to estimate the operational dependability
of a machine.

Optimal adjustment of the extrapolation function in respect of the
10 database is effected according to the invention not by means of a
maximum correlation coefficient r but using a measure of quality
(K), which is independent of the gradient of an adjustment curve in
respect of a database.
